

STARRY NIGHTS

May 2017

HOW TO USE THIS MAP

MPM's sky map shows the night sky as it appears on various dates and times. The sky lies overhead so we've designed the map to be held above your head. Compass directions are indicated along the edge of the circle. Turn the sky map around its center so the compass direction that appears along the bottom of the map is the same as the direction that you face. Begin by using the sky map to find a bright star pattern in the sky.

BEST VIEWS

This chart should be used within an hour of the times listed: 11 p.m. in early May and 10 p.m. in late May. It is drawn for 43 degrees latitude but may be applied throughout the continental United States.

MAY MORNING SKY

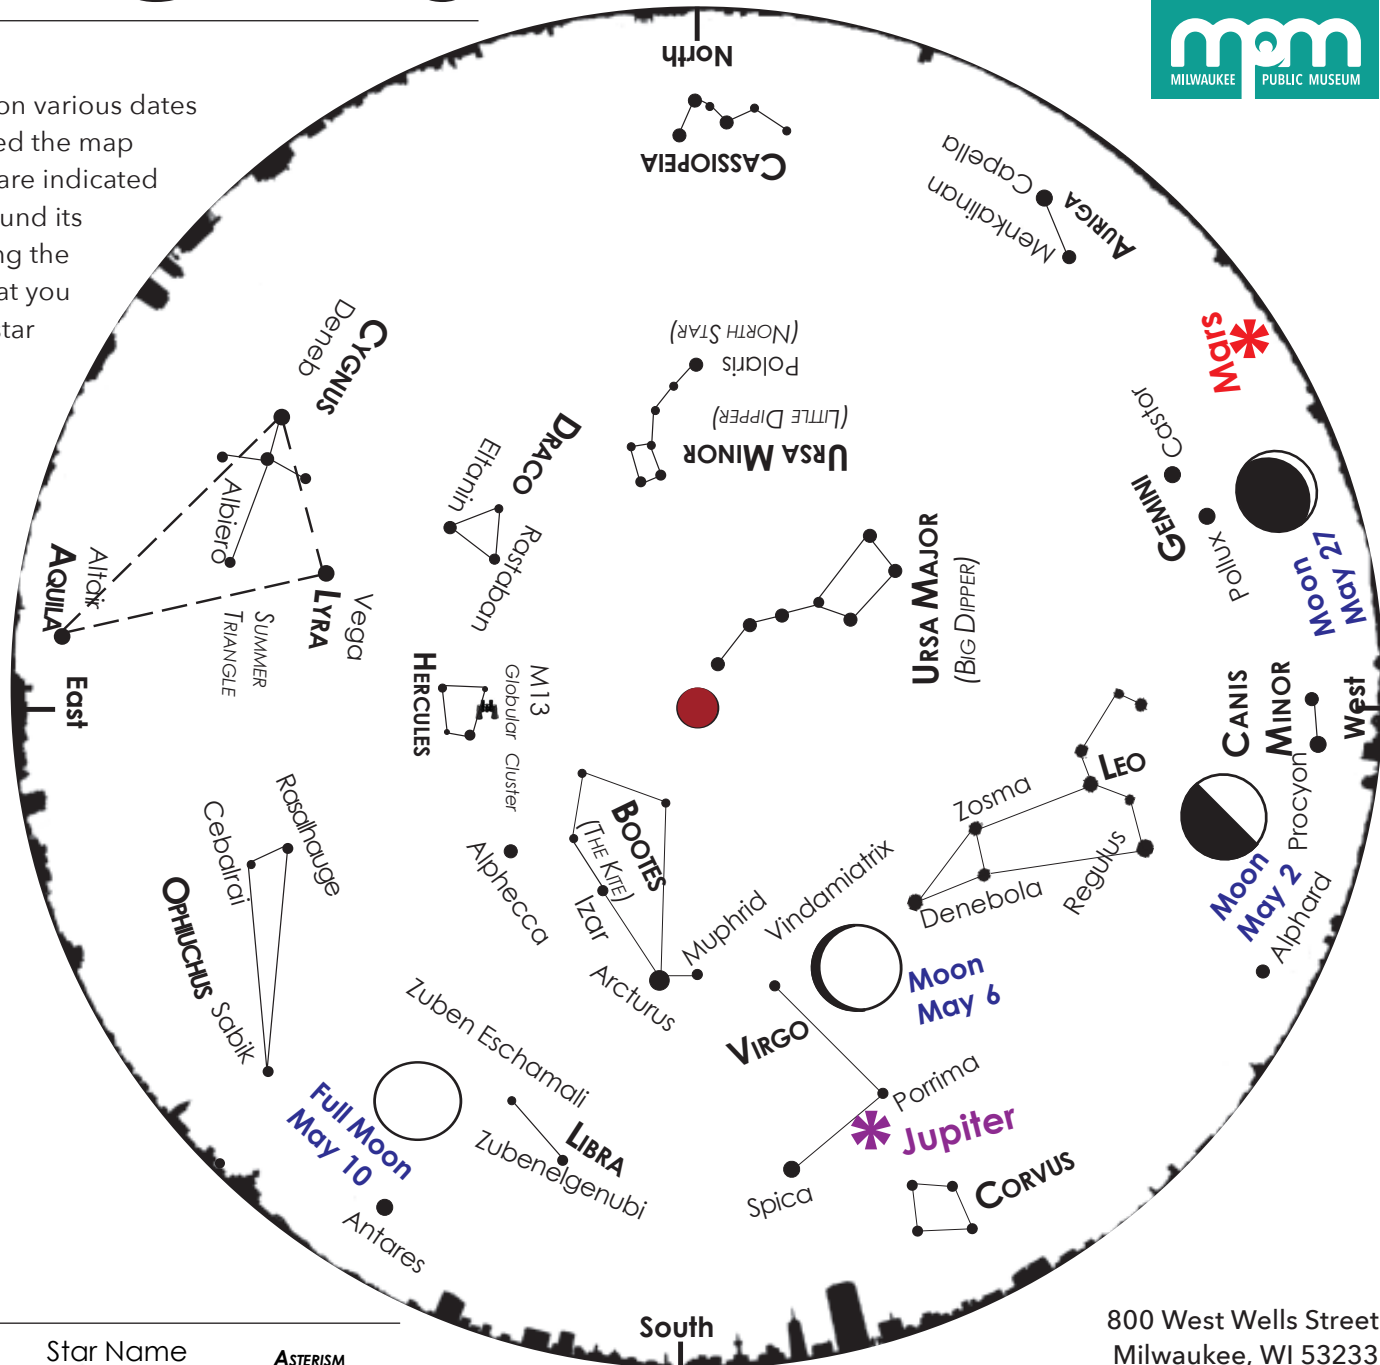

Look for the Great Square of Pegasus in the east. Summer Triangle will be high in the sky. Venus is very easy to spot in the east while Saturn is low in the SW sky.
