

# STARRY NIGHTS

May 2016

## HOW TO USE THIS MAP

MPM's sky map shows the night sky as it appears on various dates and times. The sky lies overhead so we've designed the map to be held above your head. Compass directions are indicated along the edge of the circle. Turn the sky map around its center so the compass direction that appears along the bottom of the map is the same as the direction that you face. Begin by using the sky map to find a bright star pattern in the sky.

## BEST VIEWS

During early May, it's best to use this chart at 11 p.m. but later in the month you can best view the stars around 10 p.m. This chart is drawn for 43 degrees latitude but may be applied throughout the continental USA.

## MAY MORNING SKY

In the East: Spot the Great Square of Pegasus.

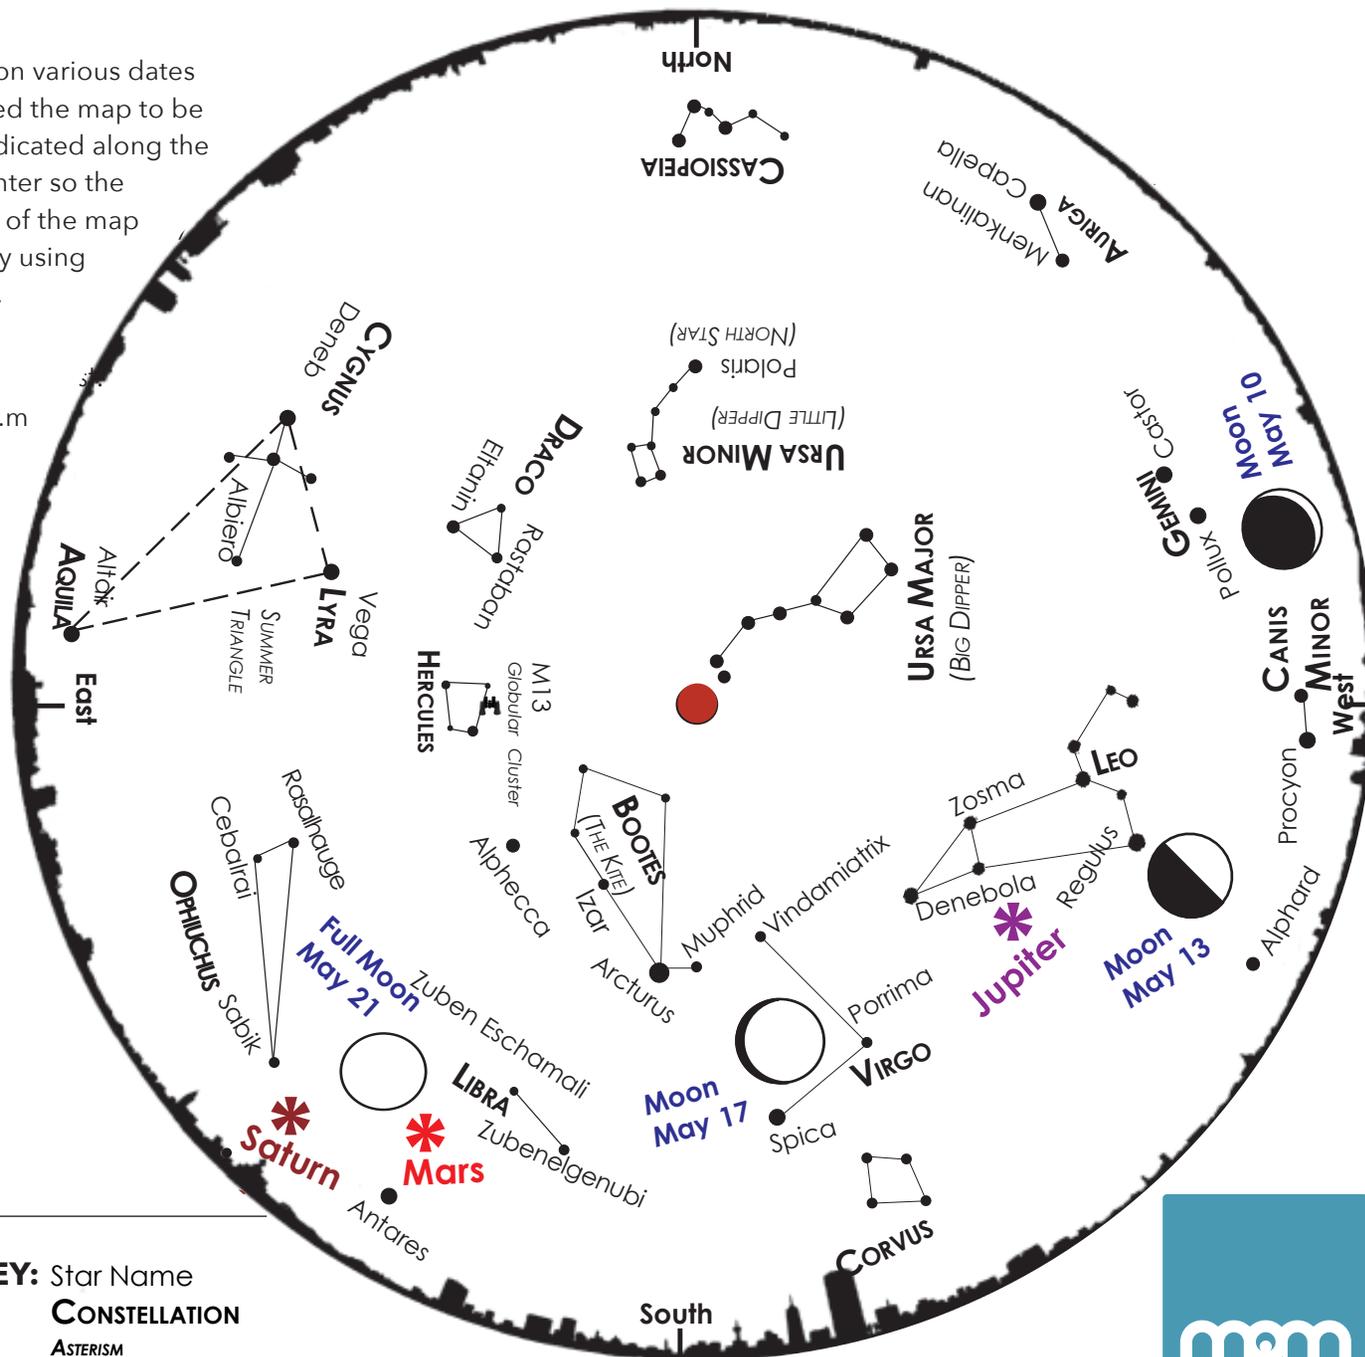

In the West: See the Summer Triangle high in the sky. Early in May, Saturn and Mars will be low in the Southwest.

## NOW PLAYING

Now Playing at the Dome Theater.  
*Wisconsin Stargazing*  
*Did an Asteroid Really Kill the Dinosaurs?*
