# STARRY NIGHTS

# **HOW TO USE THIS MAP**

MPM's sky map shows the night sky as it appears on various dates and times. The sky lies overhead so we've designed the map to be held above your head. Compass directions are indicated along the edge of the circle. Turn the sky map around its center so the compass direction that appears along the bottom of the map is the same as the direction that you face. Begin by using the sky map to find a bright star pattern in the sky.

### **BEST VIEWS**

June 1 around midnight, June 15 at 11:00 p.m., and June 30 around 10:00 p.m. Best to use the chart within an hour of the times listed. This chart is drawn for 43 degrees latitude but may be applied throughout the continental USA.

# JUNE MORNING SKY

High in the east, spot the "W" of Cassiopeia and the square that marks Pegasus. Saturn and Jupiter are high in the south sky. Get up early sunrise is around 5:15 a.m. all month!
