

HOW TO USE THIS MAP

MPM's star map shows the night sky as it appears on various dates and times. It is designed to be held above your head. Compass directions are indicated along the edge of the circle. Turn the map around its center so the compass direction that appears along the bottom of the map is the same as the direction you face.

BEST VIEWS

Early May around 11 p.m.; late May around 10 p.m. Best to use the chart within an hour of the times listed. This chart is drawn for 43 degrees latitude but may be applied throughout the continental USA.

MAY MORNING SKY

Catch Venus and Saturn and a waning crescent Moon on the mornings of May 22-23. Cassiopeia shines high overhead and Pegasus shines in the east.
